

## Projects

### Title: Five Below Mobile Treasure Hunt

*Subtitle: My Hunt prototype is currently confidential, but enjoy an article on my project workflow!*

*Text:* As the inaugural Digital Product Management Intern at Five Below during the summer of 2026, certain AI tools quickly emerged as critical conduits to the development of my project, a mobile Treasure Hunt designed to draw grade-school children into brick-and-mortar locations. As I certainly did not possess the professional experience of my Product colleagues at Five Below, strategic artificial intelligence use during development enabled me to better acclimate myself to the pace of the product lifecycle, mitigating otherwise large cross-functional gaps; however, my early observations of autonomous agent inaccuracy during ideation predicated my skepticism in AI efficacy, prompting me to evaluate how best to implement AI as a new supplement rather than a detractor.

*Quote Bar:* “My primary takeaway from my Five Below internship regarding AI usage concerns humanistic considerations rather than technical capability.”

I’ve opted to withhold public disclosure of the project details due to ongoing Treasure Hunt development, but instead detailed my tailored AI-integrated workflow for the project (upon request from my supervisor) on Medium; the article describes the broader cross-functional methodologies and operational nuances of the Treasure Hunt project, identifying the underlying strategies that ultimately shape decision-making in Product.

If interested in reviewing my Five Below Treasure Hunt initiative privately, please contact me via email to schedule a call!

---

### Title: TikTok Hero Ad Feature

*Subtitle: A novel mobile advertising proposal to drive TikTok Shop adoption among small businesses and boutiques.*

*Text:* While leisurely browsing TikTok in my free time, I observed that ads promptly redirecting to external storefronts quickly lost my focus as a consumer, posing both an underlying business gap. As TikTok Shop (the platform’s integrated e-commerce page) commissions only comprise a small fragment of their total revenue, the opportunity exists to convert small businesses running TikTok external ads into TikTok Shop stores, establishing an additional revenue stream from individual businesses.

As I do not have access to internal TikTok metrics, I based my project on the core assumption that small businesses running TikTok external ads see low sales conversion due to high user friction, thus

preventing business TikTok Shop adoption; I believe that novice business owners engage most strongly within tangible results, meaning that optimizing user conversion on external redirection ads would improve downstream TikTok Shop adoption amongst such business owners!

*Quote: “No effective “middle ground” exists for small businesses wanting to pilot TikTok Shop before full adoption.”*

My presentation provides a high-level overview of the project, including the associated market opportunity, operational prototype, business implications, and strategic risks; if interested in learning more, please select the “View Content” button above to access the pitch deck and dedicated product demonstration videos!

---

Title: Abercrombie & Fitch Playground

*Subtitle: A modular and bold boys streetwear collection winning the 2026 A&F Sophomore Summit!*

*Text:* Selected for the 2026 A&F Sophomore Summit amongst a diverse pool of students, my team of ten students endured a rapid two day sprint to pitch a holistic clothing campaign to Abercrombie management, including clothing designs, omni-channel marketing strategy, inventory allocation/distribution, and financial projections. Despite our initial enthusiasm, our team quickly reached an impasse while brainstorming; with so many existing premium products, what design concept would best match the Abercrombie brand image and catalogue?

After much discussion, our answer lay in direct investment into a generation of new and young parents desiring a contemporary look for their children. Our A&F Playground Boys clothing line is youthful, bold, and fun, setting the tone for cool kids on the block by allowing mix-and-match selections! Considering the marketing focus of the event, our project also heavily prioritized omni-channel engagement to better retain our target demographic: AI outfit curation crafts personalized outfits for parent-child pairings, and national "playdate" activation events allows kids to proudly wear their clothing for fellow Abercrombie enthusiasts!

*Quote: “Children are meant to feel confident, express themselves, and make memories that last long after they outgrow their clothes.”*

The ultimate victory of the Playground collection in the Sophomore Summit competition was validation of my team’s diligence in ideation and execution; embracing a cross-functional approach forced all lifecycle stages to be developed, thus providing the complete framework for a collection launch rather than a mere concept!

---

Title: Creator Copilot

*Subtitle: Building financial intelligence for the music industry's overlooked majority.*

*Text:* My work as a Lead Product Manager at Tapyoca Music comprised multidisciplinary management due to the instability of startup organization, requiring me to act as a high-functioning generalist within all business operations. As a music distribution company touting accessible products for small musicians, Tapyoca required vast scaling in client-facing production, and the Creator Copilot project epitomizes my success in doing so; Creator Copilot is an AI-powered accounting system designed to help independent musicians manage financial complexities of music production through simple conversations, avoiding the accounting experience otherwise required.

I served as an entrepreneurial lead during the Northeastern NSF I-Corps program to comprehensively identify market fit, presenting at the 2025 American Association of Independent Music and Newark Tech Week annual conferences to receive critical target user feedback and refine product vision; both ambivalence towards finances and frustration in manual accounting were ubiquitous themes throughout the customer discovery phase of the project, seamlessly presenting a market opportunity to fill!

*Quote: "Tapyoca has been actively incubating Creator Copilot through a structured development process that includes weekly strategy sessions with industry stakeholders, systematic recruitment of domain experts, and validation of core product assumptions through user interviews." - Felicia Palmer, CEO at Tapyoca Music*

Subsequently, I navigated my team of 4 project employees (including two full-stack developers, an machine learning engineer, and a financial advisor) through a rigorous nine week Scrum timeline to develop and validate Creator Copilot's MVP, conducting further user testing for revisions; the furnished Creator Copilot software is complete as of this article but absent here due to additional product testing before a formal launch!

---

Title: Catan ML Data Analysis

*Subtitle: An empirical machine learning study to identify player strategy in Settlers of Catan, the classic board game!*

*Text:* The conception of this specific machine learning project harbors a guilty confession of mine: I am highly competitive in my friends' Board Game Nights and wanted to optimize my game decision-making in Settlers of Catan, the popular settlement building game. Catan's continuous dice-rolling, player-to-player trading, and resource allocation render the game a broader resource optimization problem, making it an ideal subject for an intensive data analysis!

Collaborating with two friends on the Catan Data Analysis as a final project for our shared Machine Learning course, the study employed a myriad of diverse machine learning techniques on public datasets to effectively isolate relevant trends from extraneous information. Qualitatively, the key player insight the project ultimately identified lies in developing economies of scale; high resource volume and frequent resource trading predicated the majority of wins within the dataset, thus informing that prioritizing high probability “city” resources during initial settlement placement significantly boosts winning odds!

*Quote: “Features pertinent to card quantity (e.g. Total Loss) comprise the bulk of the important features, reaffirming that a player’s card quantity is one of the most significant predictors of their end outcome.”*

---

Title: Academic Research

*Subtitle: My diverse academic research portfolio on a spectrum of disciplines, including knowledge management, business, and education.*

*Text:* Though I have no formal published research as of this article (pending publication), I pride myself on conducting rigorous academic research, engaging in dedicated research forums to best inform future multidisciplinary direction and governance. In specific, I’ve authored five primary papers across both business and education, translating my inherent interest in human-computer interactions into measured research approaches.

My most recent independent research manuscript, *Shifting Societal Paradigms in Digital Advertising Consumption: Algorithmic Linguistic Fracture in Short-Form Social Commerce*, most distinctly portrays both my subject-area preference and research methodology; the study employs a relational Natural Language Processing (NLP) model to contrast the adverse user effects of commercial social content consumption with organic social media consumption, identifying nuances in digital community cohesion and guiding ethical social marketing.

My 2024 research paper on *The Effects of Secondary School Expenditure on US Student Standardized Testing Outcomes* is my first research work and recently garnered recognition as the Best Undergraduate Research at the 55th Annual Northeast Decision Sciences Institute! My research analyzes the underlying correlations and various nuances that exist between secondary school expenditures and student scoring on prominent standardized examinations (such as College Board's SAT and ACT tests), therefore providing a framework in allocating school funding to maximize student success.

*Quote: “This recognition reflects your excellent work representing MTSM through your research presentation at the NEDSI conference...we are proud of your effort and your contribution.” - Oya Tukel, Dean of NJIT’s Martin Tuchman School of Management*

---

Title: Robinhood Sentiment Analysis

*Subtitle: Analyzing user discourse on X following Robinhood's trading restriction on Gamestock stock during the 2020 bull run.*

*Text:* In January 2021, a group of retail investors on Reddit's WallStreetBets forum triggered a short squeeze to push GameStop's stock from roughly \$20 to nearly \$500, losing prominent institutional hedge funds billions; after mobile trading app Robinhood resultantly restricted trading on GME during the pinnacle of the bull run due to clearing house limitations, public backlash was immediate and visceral, reflecting the broad antagonisation that previously stable institutions incurred during the phenomenon. My specific project does not concern the efficacy of the decision itself but rather the substance of collective user sentiment, pandering to an audience of Robinhood executives to advise communication strategy when reclaiming user trust.

The analysis drew on a corpus of X (f.k.a. Twitter) posts spanning the entire week of the trading halt, processed via RAKE (Rapid Automatic Keyword Extraction) and a Topic Model to cluster pertinent keywords and unveil underlying user commonalities without supervised labeling; overall, the sentiment arc across the week conveyed deep-rooted distrust pandering beyond mere superficial anger, characterized most notably by user calls for congressional action. Given increased multifaceted scrutiny from both public consumers and private congressional hearings, the analysis subsequently poses apologizing, rationalization, and reformation as the three core actionable insights required to rehabilitate Robinhood's brand image.

*Quote:* "The prominence of trust in Emotion Analysis conveys the full effect of the restricted trading; Robinhood users place great trust in the platform, and the events of late January violated such trust."

---

Title: ReMatter Waste-to-Energy Project

*Subtitle: Creating an AI-mediated Waste-to-Energy software prototype to inform sustainable energy initiatives for my local community!*

*Text:* During a discussion at NJIT on New Jersey's conservation efforts, my friend made an interesting observation that deeply resonated with me in the ensuing days:

*Quote:* "New Jersey is teetering on the cusp of a sustainability crisis and threatening to regress back to record-high pollution rates of the early 2000s; the solution must surely lie within optimizing the rate of energy production for renewable energy sources..."

To test my friend's hypothesis, I led a marketing validation effort through the prestigious Princeton Northeastern NSF I-Corps program, conducting field interviews with sustainability stakeholders at the

24th New York Clean Energy Conference to determine the existence of a critical market gap; subsequent confirmation of a need for optimizing waste-to-energy services spurred us to begin a proof-of-concept project, crafted with the intent of informing future energy infrastructure in New Jersey rather than delivering a furnished industry-ready product.

Accordingly, I led technical development of the project's web-based monitoring dashboard via NJIT's Spring 2026 YWCC Capstone Program, driving sprint timelines and coordination for a team of eight developers; the final robust dashboard prototype ultimately successfully integrated into a miniature hardware proof-of-concept to simulate complex waste-to-energy systems in a controlled environment, both validating the immense AI framework potential and earning the team second prize within our Capstone track!
